                                                                                                                                                                                                                                                                 allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                     and 78 respectively. The invention relates to canine or feline Fit-3 ligand, canine or feline Fit-3 ligand, canine or feline CD134 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including

Sequences 25552-25560 and 255561-25566 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine and 78 respectively. The invention relates to canine CD40, canine or feline CD40 (interferon-alpha (IRN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated inmunoregulatory proteins. The prophlactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               agcoctgtgactccctccccaaccctcaaggagctcattgaggagctggtcaacatcacc 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       coquences encoding canine interletes to canine and 78 respectively. The invention relates to canine confidence and 78 respectively. The invention relates to canine confidence of feline Fit-73 ligand, canine or feline col54 (cod0 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GWCSF), and nuclecties which encode these immunoregulatory proteins. The proteins their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection, and in detection, and in detection, and also be used in detection.

interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including tallergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for and in detection, and in detection, and in the proteins may be used in detection, and is a sources.

caquences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
CE 11-4, canine or feline Fit-1 3 ligand, canine or feline CD40, canine or feline encoding canine or feline cD40, canine IL-13, feline
CE interferon-alpha (IFN-alpha) and feline granulocyte macrophage
CE interferon-alpha (IFN-alpha) and feline granulocyte macrophage
CE interferon-alpha (IFN-alpha) and feline granulocyte macrophage
CE colony stimulating factor (GMCSF), and nucleotides which encode these
CE interferon actions. The proteins. Their associated
CE nucleic acids, specific antibodies and inhibitors may be used as
CE vaccines for therapeutic or prophylactic regulation of an immune
CE response in animals (particularly cats, dogs, horses and humans).
CE They may be used to treat autoimmune or infectious diseases including
CE allergies, tumours, inflammation and graft rejection, and to increase
CE can also be used for the recombinant production of a protech, while
CE nucleic fragments are useful as probes, as amplification primers and
CE as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
CE modulators of activity, while the antibodies may be used in detection,
CE and in the control of a protein may be used and the action, and to screen for and in the control of a cativity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        357

The invention relates to canine in the invention relates to canine or feline Filt-3 ligand, canine or feline CD40, canine IL-13, feline interferon-alpha (IRN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allowing themselves.

                                                                                                                                                                                 ά
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            sequences encoding canine interieur, 13.7 (11-13) clones 80
and 78 respectively. The invention relates to canine
11-4, canine or felline Flt-3 ligand, canine or felline CD40, canine or
felline CD154 (CD40 ligand), canine IL-5, canine IL-13, felline
colony-stimulating factor (GMCSF), and nucleotides which encode these
clony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins associated
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The prophlactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ï

Sequences 25552-25560 and 255561-25566 represent cDNA sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention relates to canine in the control of the sequences encoding canine interleukin-13 (IL-13) clones 80 and 78 respectively. The invention or felline CD160, canine or felline Fli-13 ligand, canine or felline CD154 (CD40 ligand), canine IL-5, canine IL-13, felline interferon-1apha (IRN-alpha) and felline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, fumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for and in druction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1034

                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
11-4, canine or feline Flt-3 ligand, canine or feline CD40, canine or feline CD54 (CD40 ligand), canine IL-5, canine IL-13, feline
conference and the Flt-3 ligand, canine or feline CD40, canine or
feline CD54 (CD40 ligand), canine IL-5, canine IL-13, feline
colony-stimulating factor (GMCSF), and nucleotides which encode these
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
colony-stimulating factor (GMCSF), and inhibitors may be used as
concluded frespentic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
concludes, tunnours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,

sequences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
IL-4, canine or feline Fit-13 ligand, canine IL-13, feline
IL-4, canine or feline Fit-13 ligand, canine IL-13, feline or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline
interferon-alpha (IFN-alpha) and feline granulocyte macrophage
colony stimulating factor (GMSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
nucleic acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Interleukin-13; IL-13; antibody; canine; inhibitor; immune response; immunoregulation; tumour; cancer; autoimmune disease; vaccine; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nucleic acids encoding immunoregulatory proteins from cats or dogs, useful for treating or preventing e.g. tumors or autoimmune disease

and 78 respectively. The invention relates to canine
IL-4, canine or feline Fit-2 ligand, canine IL-13, feline or feline Fit-2 ligand, canine IL-3, feline or feline Fit-2 ligand, canine IL-13, feline or feline colfs4 (CD40 ligand), canine IL-2, canine IL-13, feline or feline colfs4 (CD40 ligand), canine IL-3, and nucleotides which encode these interferon-alpha (IFN-alpha) and feline granulocyte-macrophage
colony-stimulating factor (GMSF), and nucleotides which encode these immunoregulatory proteins. The proteins may be used as nucleic acids, specific antibodies and inhibitors may be used as concines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and

                                                                                                                                                                                                                                                           the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides) The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
           and 78 respectively. The invention relates to canine or feline CD154 (CD40 ligand), canine or feline Flt-3 ligand, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IRV-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the contract of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   241 acccagaggatgctgaaagcactgtgctctcaaaagcccgcggcagggcagatttccagt 300

caquences encoding canine interletions (11-13) clones 80
and 78 respectively. The invention relates to canine
TL-4, canine or felline Fit-3 ligand, canine or felline CD40, canine or felline
TL-4, canine or felline Fit-3 ligand, canine IL-3, felline
The CD154 (CD40 ligand), canine IL-5, canine IL-13, felline
interferon-alpha (IFN-alpha) and felline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
colony-stimulating factor (GMCSF), and nucleotides may be used as
nucleic acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are useful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 agccctgtgactccctcccaaccctcaaggagctcattgaggagctggtcaacatcacc 120

Human low adenosine antisense oligonucleotide related sequence #2901.

(first entry)

14-MAR-2001

F21334;

F21334 ID F21334 standard; DNA; 1270 BP.

```
caquences encoding canine interleukin-13 (IL-13) clones 80
and 78 respectively. The invention relates to canine
L1-4, canine or feline Fit-3 ligand, canine or feline CD40, canine or feline CD40, canine IL-3, feline
interferon-alpha (IFN-alpha) and feline granulocyte macrophage
colony-stimulating factor (GMCSF), and nucleotides which encode these
immunoregulatory proteins. The proteins, their associated
nucleic acids, specific antibodies and inhibitors may be used as
vaccines for therapeutic or prophylactic regulation of an immune
response in animals (particularly cats, dogs, horses and humans).
They may be used to treat autoimmune or infectious diseases including
allergies, tumours, inflammation and graft rejection, and to increase
the response from a co-administered antigen. The nucleotide sequences
can also be used for the recombinant production of a protein, while
nucleotide fragments are usedful as probes, as amplification primers and
as sources of inhibitory therapeutics (e.g., antisense oligonucleotides).
The proteins may be used to raise antibodies and to screen for
and in druct parefiting.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 gctggtcaacatcacccagaatcaggcatccttgcaacggcaggaggtgtgggaggt 120

coligonucleotides and compositions tow accurate (A) content antibeense oligonucleotides the A is replaced by a 'Universal' or alternative base. C(I) can have respiratory, bronchodilator, antibilinflammatory, analgesito, antipastive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypepitides associated with undy-respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, central ceptors, adenosine receptors, bradykinin receptors, central nervous system peptide ceptors, adenosine receptors, bradykinin receptors, central nervous and non-nervous system peptide antisense oligonucleotides may be used in this way to treat disorders antisense oligonucleotides may be used in this way to treat disorders and/or surfactant hypoproduction (especially pulmonary obstruction (especially pulmonary obstruction (especially pulmonary obstruction (especially pulmonary distress syndrome and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, allergics asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary conditions emphysama, chronic obstructive pulmonary disease (CDD), pulmonary infections, bronchtis, and or and antisense oligonucleotides used in the exemplification of the present invention present invention
                                                                                                                                                        Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention describes low adenosine (A) content antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Page 1336; 1592pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 15, Sequence 17, Sequence 24, 1

```
was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with 74 DNA polymerase and 74 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Contact: Scares, MB

polylinker; Site_l: Not I; Site_2: Eco RI; The UI-R-AFI
library is a normalized library constructed from 15 dpc
rat atrioventricular (AV) canal. The tag is a string of 5
nucleotides present between the Not I site and the
oligo-dT track. The library was constructed as described
                                                                                                                                                                                                  oligo-dr track. The library was constructed as described by Bonaldo, Lennon and Soares, Genome Research 6: 791-806 , 1996. Tissue provided by Jim Lin, Department of Biology, University of Lowa.
